
Skarf Docs

Release 0.2.1

Woofers

Jul 10, 2022

INSTALLING

1	Installation	3
1.1	With Docker	3
2	Configuring Skarf	5
2.1	Examples	5
2.2	What everything means	8
3	Make Skarf Static	11
4	Credits	13
4.1	Contributors	13
4.2	Images	13
4.3	Other Credits	13

Welcome to the skarf docs which teaches you how to install and configure skarf. Project Source: [Github](#)

INSTALLATION

It is relatively easy to setup skarf with docker.

1.1 With Docker

Install Docker: [Get Docker](#)

1.1.1 Docker Compose

`docker-compose.yml`

```
version: '3.3'
services:
  app:
    container_name: skarf
    ports:
      - '8080:80' # To expose skarf onto the host machine (remove this if you are
↳ using a reverse proxy such as traefik)
    volumes:
      - './static:/app/static' # To store data in the [website]/static/ url
      - './config:/app/config' # To store the config.yml config
    image: 'ghcr.io/woooferz/skarf:master'
```

Then run `docker-compose up` and CTRL+C to get out of it and configure it. Help: [Configure Skarf](#)

1.1.2 Docker CLI (Untested) (Not Recommended)

Run this command:

```
docker run --name skarf -p 8080:80 -v /path/to/static:/app/static -v /path/to/config:/
↳ app/config ghcr.io/woooferz/skarf:master
```

To get out you probably need to do `docker stop skarf` from another shell and then you can configure it. Help: [Configure Skarf](#)

CONFIGURING SKARF

You can configure skarf with YAML and JSON. To configure skarf (in docker) you'll need to mount `/app/config` to a local directory, and then you can put a `config.json` or `config.yml` into that folder. You can see examples of configs on this page, and further down there is a section which tells you what everything means.

2.1 Examples

2.1.1 Example YAML (config.yml)

```
version: 4 # pls no touch this
debug: false
settings:
  name: "Person" # Main name
  subtitle: "Some for info" # A little text below name
  font: Roboto, Arial # The font-family to use for the page
  verified: false # adds a cool checkmark
  check-color: '#55FF11' # decides the color of checkmark
  color: "#6F6F6F" # The color of the name and subtitle
  link-color: "#F6F6F6" # The color of the text on the links
  glass-card: true # If the image, name, subtitle and links should be displayed on a
↳ glass-like card
  custom-css: false # OPTIONAL! url to custom css
  font-awesome:
    pro: false # if you have pro set to true
    pro-url: "/idk/here/maybe" # if you have pro enter url here, either a local one such
↳ as /static/fontawesome-pro.css or an external one such as https://fontawesome.example.
↳ com/pro.css (BOTH OF THESE WON'T WORK, GET YOUR OWN LINK)
  glass:
    color: "#FFFFFFAA" # color of the glass effect simply remove this if you enjoy the
↳ current color
  background: # The background info
    type: color # image or color or gradient Decides what to put as the background
    content: "#2F2F2F" # url to image or a color code (e.g. /static/bg.png) or the first
↳ color of a gradient
    content-2: "#FFFFFF" # only used when there is a gradient, the second color of
↳ gradient
  favicon: /static/favicon.png # If you want a favicon
  description: Some info in the meta description tag # If you want a meta description
  image:
```

(continues on next page)

(continued from previous page)

```

type: font-awesome # image or font-awesome decides how to display avatar
style: solid # for font-awesome. Decides what style to display the icon
content: user # font-awesome icon name, or url to image
links:
- name: Skarf Docs # Friendly Name of link
  link: https://skarf-docs.readthedocs.io/en/latest/index.html # The link to the link
  image: # same as the 'image' item above
    type: font-awesome
    style: solid
    content: book
  color: "#3F3F3F" # the background color of the link
- name: Skarf Github # same as item above
  link: https://github.com/woooferz/skarf
  image:
    type: font-awesome
    style: brands
    content: github
  color: "#3F3F3F"
- name: Support Discord
  link: https://discord.gg/VnskbWb4Ft
  image:
    type: font-awesome
    style: brands
    content: discord
  color: "#454FBF"
mini-links: # different from 'links' as it is only an image/icon with a link. AKA no
↪text.
- link: https://github.com/woooferz/skarf # Link to the service
  image: # same as the 'image' item above
    type: font-awesome
    style: brands
    content: github
  color: "#3F3F3F" # color of it

```

2.1.2 Example JSON (config.json)

```

{
  "version": 4,
  "debug": false,
  "settings": {
    "name": "Person",
    "subtitle": "Some for info",
    "font": "Roboto, Arial",
    "verified": false,
    "check-color": "#55FF11",
    "color": "#6F6F6F",
    "link-color": "#F6F6F6",
    "glass-card": true,
    "custom-css": false,
    "font-awesome": {

```

(continued from previous page)

```

    "pro": false,
    "pro-url": "/idk/here/maybe"
  },
  "glass": {
    "color": "#FFFFFFAA"
  },
  "background": {
    "type": "color",
    "content": "#2F2F2F",
    "content-2": "#FFFFFF"
  },
  "favicon": "/static/favicon.png",
  "description": "Some info in the meta description tag",
  "image": {
    "type": "font-awesome",
    "style": "solid",
    "content": "user"
  },
  "links": [
    {
      "name": "Skarf Docs",
      "link": "https://skarf-docs.readthedocs.io/en/latest/index.html",
      "image": {
        "type": "font-awesome",
        "style": "solid",
        "content": "book"
      },
      "color": "#3F3F3F"
    },
    {
      "name": "Skarf Github",
      "link": "https://github.com/woooferz/skarf",
      "image": {
        "type": "font-awesome",
        "style": "brands",
        "content": "github"
      },
      "color": "#3F3F3F"
    },
    {
      "name": "Support Discord",
      "link": "https://discord.gg/VnskbWb4Ft",
      "image": {
        "type": "font-awesome",
        "style": "brands",
        "content": "discord"
      },
      "color": "#454FBF"
    }
  ],
  "mini-links": [
    {

```

  "style": "brands",
  "content": "github"
},
"color": "#3F3F3F"
}
]
}
}
```

2.2 What everything means

`version` Version of renderer to load config with.

`debug` If debug mode is on which reloads config on every load and shows some version info on page

`settings.name` The title of the card, usually your name/nickname.

`settings.subtitle` Text beneath `settings.name` with a smaller font size.

`settings.font` Font of the card, needs to be installed on the viewers device.

`settings.verified` Verification status, if set to true it adds a cool little checkmark

`settings.check-color` Decides the color of the checkmark if `settings.verified` is set to true, if not set it will be the color of `settings.color`

`settings.color` Text color of `settings.name` and `settings.subtitle`.

`settings.link-color` Text color of all the links.

`settings.glass-card` If the card should have a glass effect. (From [css.glass](#))

`settings.custom-css` A link to custom css

`settings.font-awesome.pro` If you want pro url enabled (true/false)

`settings.font-awesome.pro-url` The link to fontawesome pro you want to use only used if `settings.font-awesome.pro` is enabled.

`settings.glass.color` Optional! If you want a custom color on the glass effect

`settings.background.type` Either color or image or gradient. Decides the type of background your card will have.

`settings.background.content` If `settings.background.type` is color then use a hex color code, if it is image then use a image url. If it is gradient then use the first gradient value

`settings.background.content-2` Only used if `settings.background.type` is gradient, sets the second gradient value

`settings.favicon` Path to a favicon.

`settings.description` Meta description for your card.

`settings.image.type` Either font-awesome or image. Decides the type of avatar you will have.

`settings.image.style` Only useful if you are using font-awesome, it will decide what style of icon you will have. It can be solid or brand, assuming you have the free tier of font awesome

`settings.image.content` If `settings.image.type` is font-awesome it is an icon name. If it is image then an image url.

`settings.links` An array/list of links.

`settings.links.name` The display text of a link.

`settings.links.link` The link of a link.

`settings.links.image` Same as `settings.image`.

`settings.links.color` The background color of a link.

`settings.links.text-color` Overrides `settings.link-color`, it sets the color of the link

`settings.mini-links` Like `settings.links` but it only has a icon and appears in one line, it is an array/list

`settings.mini-links.link` The link of the item

`settings.mini-links.image` Same as `settings.image`

`settings.mini-links.color` The color of the link

MAKE SKARF STATIC

Skarf is created with flask and it will take up your server resources as it is being rendered on the server side. To fix this you can make it static with a workaround kinda thing. Do this after you have finished configuring skarf and you just want the static files left.

First you will need `wget`, it can be installed on unix based systems.

Run this command:

```
wget --recursive --no-clobber --page-requisites --html-extension --convert-links -  
↳ restrict-file-names=windows [link to your skarf instance]
```

This will download your skarf instance and you will be able to view it in static form.
